Digitization In Business - Inspection Going Digital

As technology evolves with each passing day, so must our business and trading techniques. Bari fulfils this need by implementing digitization in many different parts of the industry, remarkably increasing productivity and efficiency. With digitization, comes the ability to take advantage of analytics and real user data. This enables us to better manage the load on our inspectors by using automatic scheduling and automatic reminders to create a more structured procedure for tracking inspections. Advancements have been made in the overall quality and accuracy of each shipment. Another major advantage we get from digitization is the ability to make more informed decisions, due to the easily accessible and organized data. All in all, digitization has played an important role in improving our inspections and modernizing our business techniques.

In terms of product traceability, digitization has helped us to keep a better track of our products. Developments have been made in inventory management techniques and the use of machines and coded IDs have remarkably reduced the room for error. Real-time results allow us to identify any problems and effectively deal with them, maintaining product accuracy.

One of the major benefits that we get with the implementation of digitization is the feasibility and comfort of workers, encouraging employee engagement. Counting, stacking, and even searching for any particular inspection is now automated. A precoded ID has been assigned to the loaded images with security and privacy being maintained wherever necessary.

Sustainability Update

The current industry methods and procedures are a threat to the sustainability of our environment. There are only a few platforms that take their time out to focus on this critical issue. Our environment suffers from inappropriate manufacturing strategies and we believe that moving towards more greener methods plays a huge role in protecting our environment. Bari leads the front in this endeavour as we are making great strides in the sustainable environment sector.

The Higg assessment, which accurately measures the sustainability performance of an organization, awarded Bari a 10% increase from previous results. Further development and research in the manufacturing process have helped us save 30% more water during 2020. Electricity consumption has also been minimized while we explore new opportunities to further cut down our electricity usage. Efforts have also been made to improve the air quality surrounding our workers. Several plants have been distributed for both the factory and the houses of our associates, while thousands of trees have been planted to support the environment. Bari also keeps track of the emissions to air generated by our manufacturing processes and has taken initiatives to control it.
